

C++ now

# This is C++

Jon Kalb

2024

This is

**WHAT'S  
YOUR  
SUPERPOWER?**

Uncompromising  
performance!

This is

This is

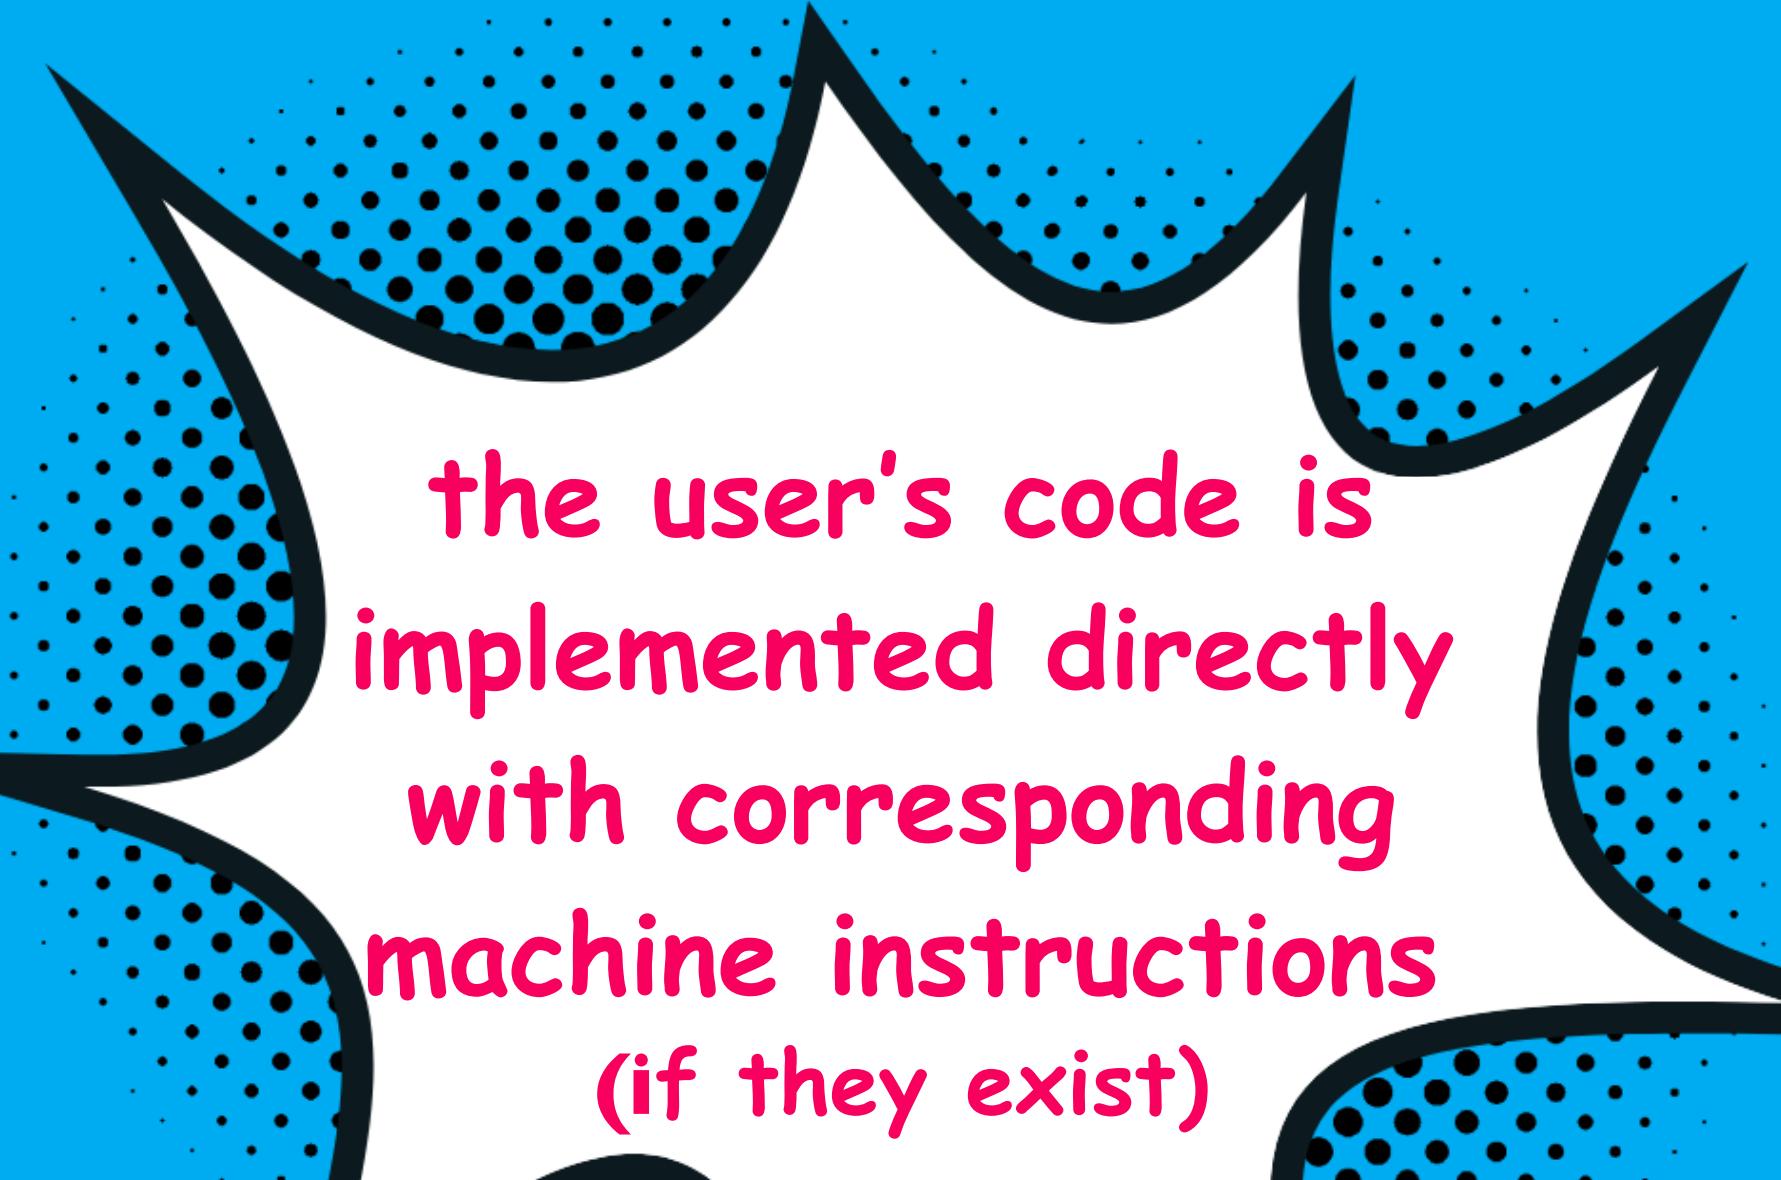

*“leave no room for a lower level language”*

– P2137R0 (Originally Bjarne Stroustrup)

## | Zero Overhead Rule

- ◆ if a feature is not used: no cost
- ◆ if a feature is used: no greater cost

How do we  
do it?

the user's code is  
implemented directly  
with corresponding  
machine instructions  
(if they exist)

C++ source #1 ✎ X C++ x86-64 gcc 12.2 (Editor #1) ✎ X

A- ☰ + v 🔍 ↻

x86-64 gcc 12.2 -std=c++11

C++ source code:

```
1 int add(int a, int b)
2 {
3     return a + b;
4 }
5
6 int mult(int a, int b)
7 {
8     return a * b;
9 }
10
11 int divide(int a, int b)
12 {
13     return a / b;
14 }
15
```

Assembly output:

```
1 add(int, int):
2     lea    eax, [rdi+rsi]
3     ret
4 mult(int, int):
5     mov    eax, edi
6     imul   eax, esi
7     ret
8 divide(int, int):
9     mov    eax, edi
10    cdq
11    idiv   esi
12    ret
```

The image shows the Compiler Explorer interface with two panes. The left pane displays C++ source code, and the right pane shows the generated assembly code for an x86-64 gcc 12.2 compiler.

**C++ Source Code (Left Pane):**

```
6 }
7
8 int mult(int a, int b)
9 {
10    return a * b;
11}
12
13 int divide(int a, int b)
14 {
15    return a / b;
16}
17
18 int div_safe(int a, int b)
19 {
20    if (b)
21        return a / b;
22    else
23        return std::numeric_limits<int>::max();
24}
```

**Assembly Output (Right Pane):**

```
x86-64 gcc 12.2 (Editor #1) -std=c++20 -Wall
x86-64 gcc 12.2
```

```
1 add(int, int):
2     lea    eax, [rdi+rsi]
3     ret
4 mult(int, int):
5     mov    eax, edi
6     imul   eax, esi
7     ret
8 divide(int, int):
9     mov    eax, edi
10    cdq
11    idiv   esi
12    ret
13 div_safe(int, int):
14    mov    eax, 2147483647
15    test   esi, esi
16    jne    .L9
17    ret
18 .L9:
19    mov    eax, edi
20    cdq
21    idiv   esi
22    ret
```

## | divide\_const

### performance cost

- ◆ twice as many instructions
- ◆ includes a branch

### note:

- ◆ simplest action on *divide by zero*  
(return a constant)

This is

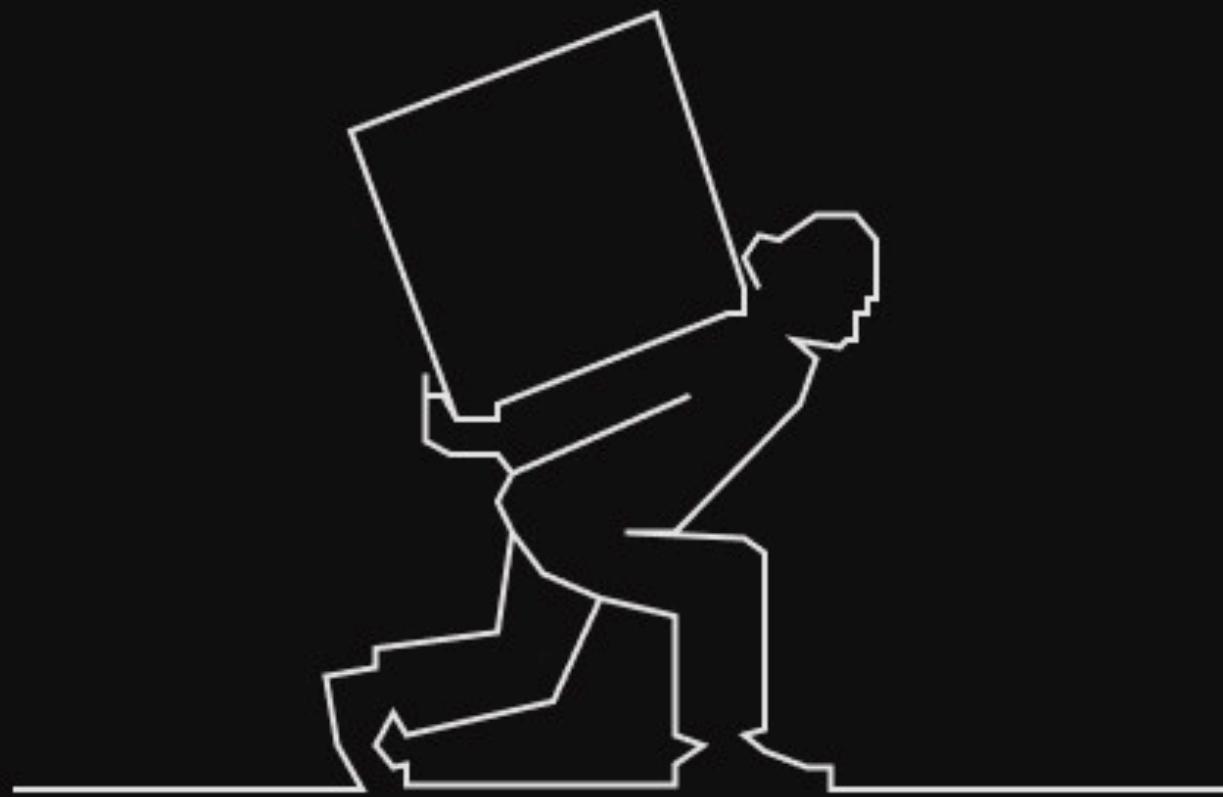

## | std::vector

both

- ◆ operator[]( ) <== efficient (not checked)
- ◆ at() <== safe (range checked)

This is

safe

fast

This is

Undefined  
Behavior!

This is

Erroneous behavior for  
uninitialized reads

P2795R5 (C++26) - Thomas Köppe

```

```

This is

```
int a{void}; // hypothetical syntax
```

```
int a{void}; // hypothetical syntax
```

```
int a = a; // legal today
```

```
int a; // hypothetical future syntax  
       // for zero initialization
```

This is

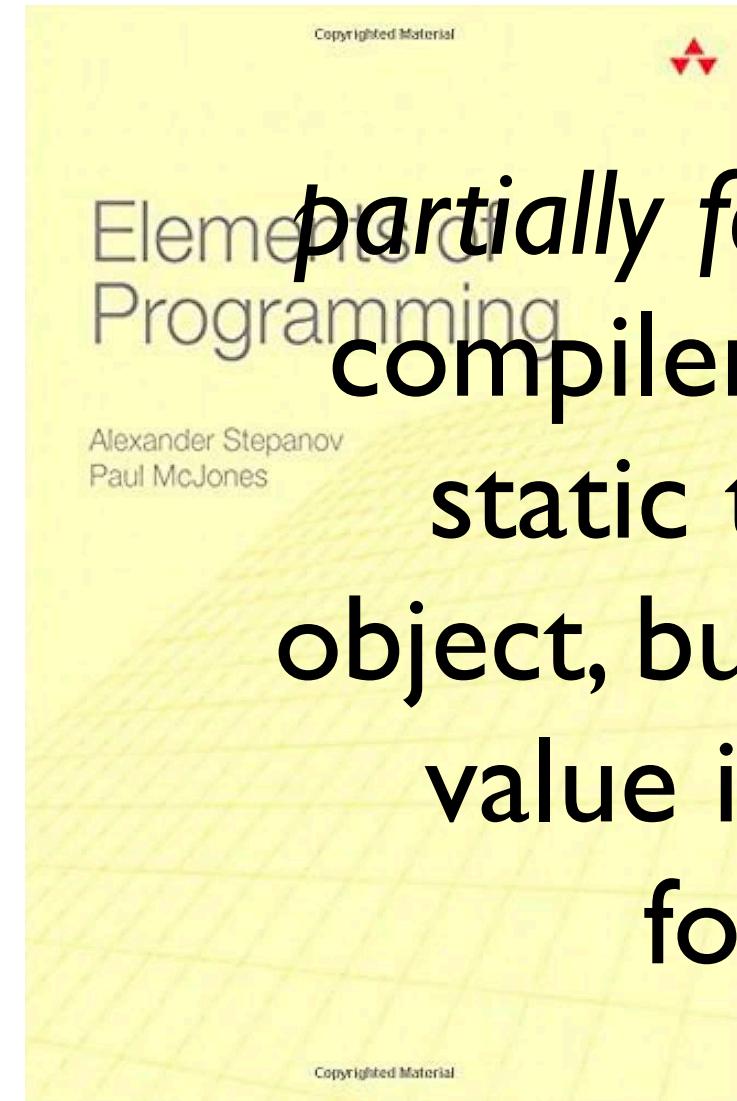

```
int a; // not initialized
```

```
int a;      // not initialized  
int b{a}; // ??
```

```
int a;      // not initialized  
int b{a}; // undefined behavior
```

```
auto double_in_place(int& v)
{
    v *= 2;
}
```

*partially formed object:*  
**compiler knows the**  
**static type of an**  
**object, but its runtime**  
**value is not fully**  
**formed**

This is

This is

Undefined  
Behavior!

```
int div_except(int a, int b)
{
    int result{a / b};
    if (not b) throw ZeroDiv{};
    return result;
}
```

Will this ever be  
thrown?

**COMPILER EXPLORER** Add... More Templates ⓘ Share Policies ⓘ Oth

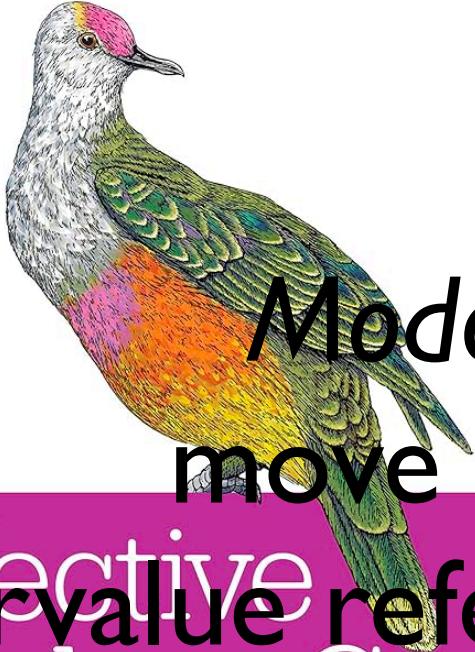

C++ source #1 C++

```
1 struct ZeroDivErr{};  
2  
3 int div_except(int a, int b)  
4 {  
5     int result{a / b};  
6     if (not b) throw ZeroDivErr{};  
7     return result;  
8 }  
9
```

x86-64 clang (trunk) (Editor #1) x86-64 clang (trunk) -std=c++20 -Wall -Wextra

```
1 div_except(int, int): # @d  
2     mov    eax, edi  
3     cdq  
4     idiv   esi  
5     ret
```

# Modern C++: move semantics rvalue reference syntax Effective Modern C++

42 SPECIFIC WAYS TO IMPROVE YOUR USE OF C++11 AND C++14

Scott Meyers

This is

```
widget::widget(  
    std::list<Gadget> && inGL  
):  
    mGadgets{std::move(inGL)}  
{}
```

Page Discussion

C++ Containers library std::vector

std::vector<T,Allocator>::vector

constexpr vector( vector&& other ) noexcept;

(since C++20)

vector move is  
*noexcept*

Page Discussion

C++ Containers library std::list

std::list<T,Allocator>::list

list( list&& other );

(8) (since C++11)

list move is  
**not noexcept**

## | move enabling

- ◆ primitive type      ==> shallow copy
- ◆ (owning) pointer ==> shallow copy,  
                          zero the source
- ◆ compound type   ==> (create and) use  
move operations that recursively follow  
these rules

## | move enabling (cont)

- ◆ primitive type      ==> shallow copy
- ◆ (owning) pointer ==> shallow copy, zero the source
- ◆ compound type   ==> (create and) use move operations that recursively follow these rules
- ◆ destructor: must be safe on moved from objects
- ◆ assignment operator: must be safe to assign to moved from objects

allocation: <some address>  
size: 10  
capacity: 16

allocation: <nil>  
size: 10  
capacity: 16

*“...a sentinel node is a specifically designated node used with linked lists and trees as a traversal path terminator. This type of node does not hold or reference any data managed by the data structure.”*

— Wikipedia

*What do we call invariants that don't always hold?*

*They are called **not invariants**.*

# Sutter's Mill

## Move, simply

 Herb Sutter

 2020-02-17

 9 Minutes

Table 33: *Cpp17MoveAssignable* requirements [tab:cpp17.moveassignable]

Expression	Return type	Return value	Post-condition
<code>t = rv</code>	<code>T&amp;</code>	<code>t</code>	If <code>t</code> and <code>rv</code> do not refer to the same object, <code>t</code> is equivalent to the value of <code>rv</code> before the assignment
<code>rv</code> 's state is unspecified.			[Note 2: <code>rv</code> must still meet the requirements of the library component that is using it, whether or not <code>t</code> and <code>rv</code> refer to the same object. The operations listed in those requirements must work as specified whether <code>rv</code> has been moved from or not. — end note]

```
unique_ptr<int> a[]  
{  
    make_unique<int>(1),  
    make_unique<int>(0)  
};  
  
sort(begin(a),  
     end(a),  
     [](const auto& a, const auto& b)  
     { return *a < *b; });
```

UB if moved from

Table 33: *Cpp17MoveAssignable* requirements [tab:cpp17.moveassignable]

Expression	Return type	Return value	Post-condition
<code>t = rv</code>	<code>T&amp;</code>	<code>t</code>	If <code>t</code> and <code>rv</code> do not refer to the same object, <code>t</code> is equivalent to the value of <code>rv</code> before the assignment

`rv` is assignable-to and destructible. [ Note:  
`rv`'s state is otherwise unspecified. ]

# *What is the meaning of these function signatures?*

```
auto foo(widget& w);
```

```
auto foo(widget&& w);
```

The blog's  
suggestion:  
these two  
mean the  
same.

```
viewPortID CreateviewPort(***) ;  
Void FreeviewPt(viewPortID vpID) ;  
int GetBitDepth(viewPortID vpID) ;  
int GetXDim(viewPortID vpID) ;
```

...

```
struct ViewPort
{
    ViewPort():  
        vpID_(CreateviewPt())  
    {/*RAII*/}  
  
    ~ViewPort(){if (vpID_)  
        FreeviewPt(vpID_);}  
    ~~~~  
  
private:  
    ViewPortID vpID_;  
};
```

How do we  
implement move  
operations?

```
struct ViewPort  
{  
    ~~~~  
    ViewPort(ViewPort&& vp):  
        vpID_(vp.vpID_)  
    {vp.vpID_ = 0;}  
    ~~~~  
};
```

```
struct ViewPort  
{
```

~~~~~

```
ViewPort(ViewPort&& vp):  
    vpID_(vp.vpID_)  
    {vp.vpID_ = 0;  
     /* Call OS to make a  
      new ViewPort */}
```

~~~~~

```
};
```

```
struct viewPort  
{
```

~~~~~

```
    viewPort(viewPort&& vp):  
        vpID_(vp.vpID_)  
        {vp.vpID_ = 0;}  
/* modify all member functions  
to “fake” something when moved  
From */
```

~~~~~

```
} ;
```

# Summary

- ◆ What is C++?
  - ◆ Uncompromised performance.
- ◆ Achieved by: living with UB,  
accepting a safety trade-off

## | Summary (continued)

- ◆ Committee: Standard types: moved from == fully formed
- ◆ This ship has sailed
- ◆ IMHO: a mistake because:
  - ◆ Minor/major performance hits
  - ◆ Leads to logic errors

## | Summary (continued)

- ◆ Committee direction: user code moved from == fully formed
- ◆ Minor reduction in cognitive load, but encourages logic errors.
- ◆ Some use cases, unacceptable performance, defeating move semantics.

## | Summary (continued)

◆ Correct:

moved from == partially formed

This is

## | Summary (continued)

- ◆ Application safety  $\neq$  language safety

This is
